

Cognitive Enhancer

**The Brain & Body Function At Their Best When Four Primary Biochemicals Are In Balance:
Acetylcholine * Dopamine * GABA * Serotonin**

One of the most important physiological functions of the brain is the ability to learn and remember. Those that have been forgetting things, misplacing items, experiencing a brain fog, or struggling to concentrate may need to increase their Acetylcholine levels.

There are many reasons why patients may have an imbalance of neuro- transmitters, including genetics, every day stress, or trauma (emotional or physical), to name a few.

As we age, our bodies produce fewer hormones that regulate neurotransmitters, throwing off its balance. Even at a young age, neurotransmitters can be unbalanced resulting in any number of neurological changes. Imbalances may be minimal, but over time can eventually progress and have a significant impact on how we feel and function. Left unchecked, an imbalance can lead to a slide in overall health and impair one's work performance as well.

Lapses in memory are not something we necessarily have to live with and face as a consequence of aging. They may be a concrete indication of chemical deficiencies within the brain itself. Often, mild deficiencies can be reversed, resulting in improved cognitive function.

Cognitive Enhancer was developed to address acetylcholine need, and to give the brain the nutrients it needs to function at a higher level.
